Purposes of this presentation

- Review current standards, frameworks, and guidelines
- Discuss theory and practice in the real world
- Sharing of mistakes and lessons learned

Topics

- DFIR review
 - Processes, techniques, limitations, and workarounds
 - Cooperation between CSIRT and LE
- Case studies
 - Case #1: Live incident response
 - Case #2: Investigating banking trojan
- Q&A

What is DFIR?

Digital Forensics and Incident Response (DFIR) is a field within cybersecurity that focuses on the identification, investigation, and remediation of cyberattacks.

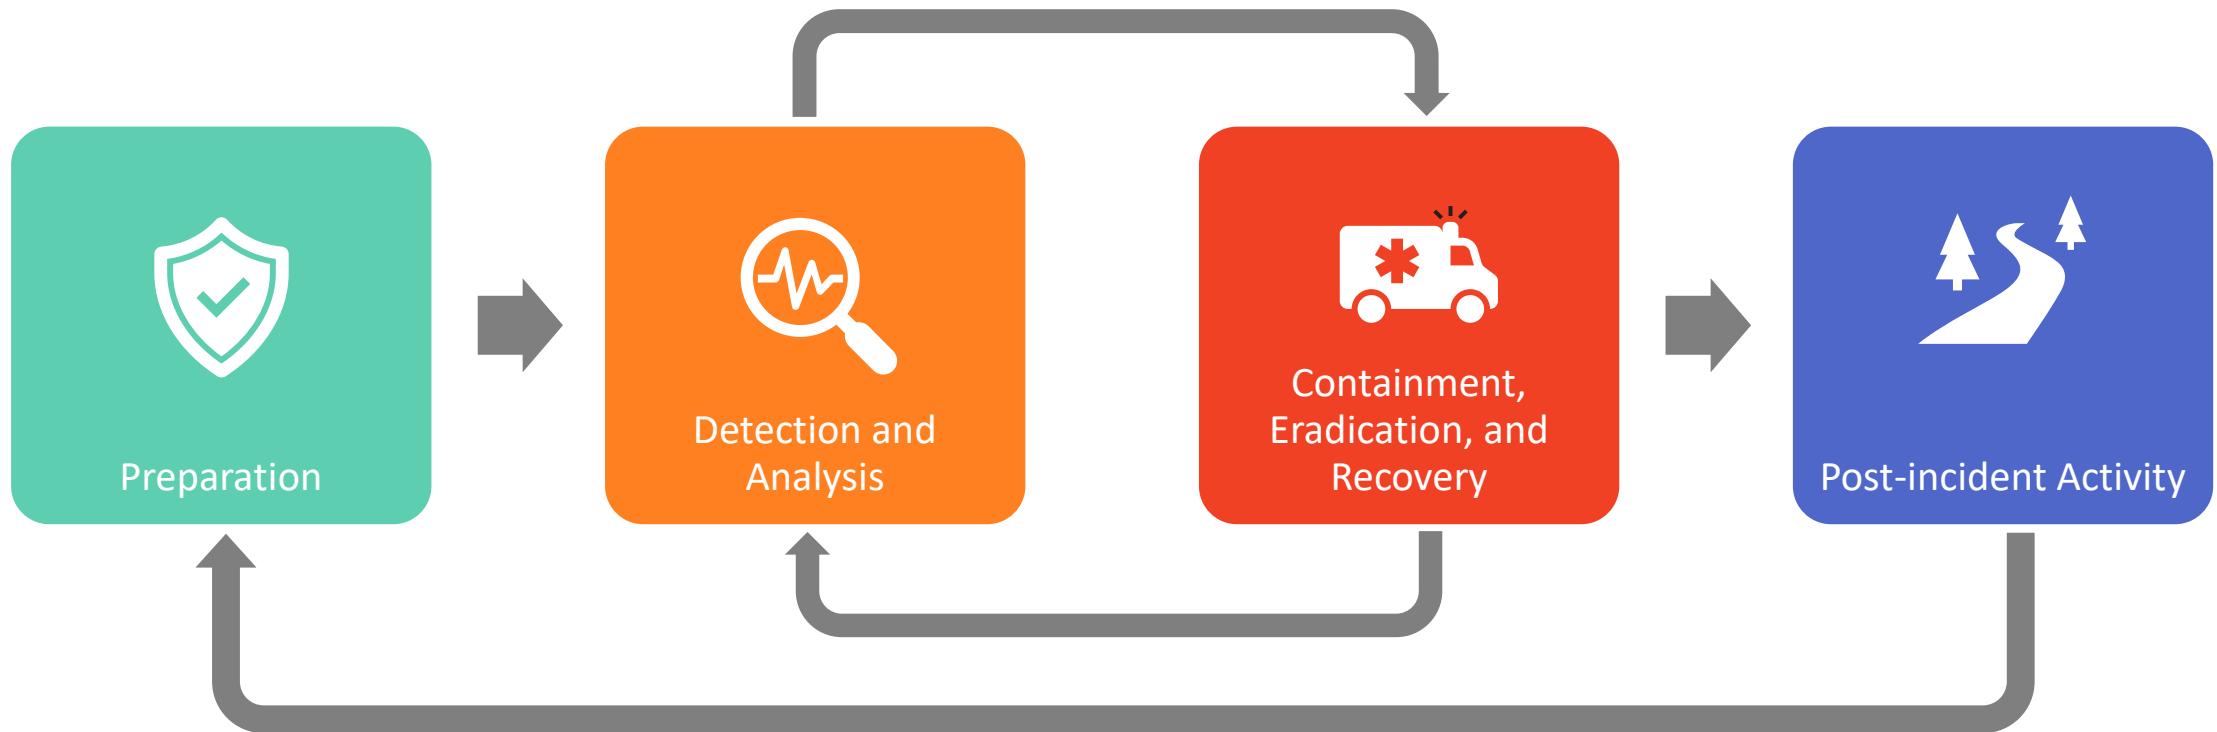

DFIR has two main components:

- **Digital Forensics:** A subset of forensic science that examines system data, user activity, and other pieces of digital evidence to determine if an attack is in progress and who may be behind the activity.
- **Incident Response:** The overarching process that an organization will follow in order to prepare for, detect, contain, and recover.

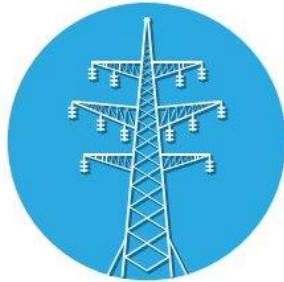

Comparison of incident response frameworks

Incident response step	NIST SP 800-61r2	SANS IR	ISO/IEC 27035:2023
Planning	Preparation	Preparation	Plan and Prepare
Preparation			
Detection			Detect and Report
Reporting	Detection and Analysis	Identification	
Assessment			Assess and Decide
Decision			
Containment		Containment	
Eradication	Containment, Eradication, and Recovery	Eradication	Respond
Recovery		Recovery	
Lesson learned	Post-incident Activity	Lesson learned	Learn lessons

Digital Investigation Techniques: A NIST Scientific Foundation Review

Published: November 21, 2022

Author(s)

James R. Lyle, Barbara Guttman, John Butler, Kelly Sauerwein, Christina Reed, Corrine Lloyd

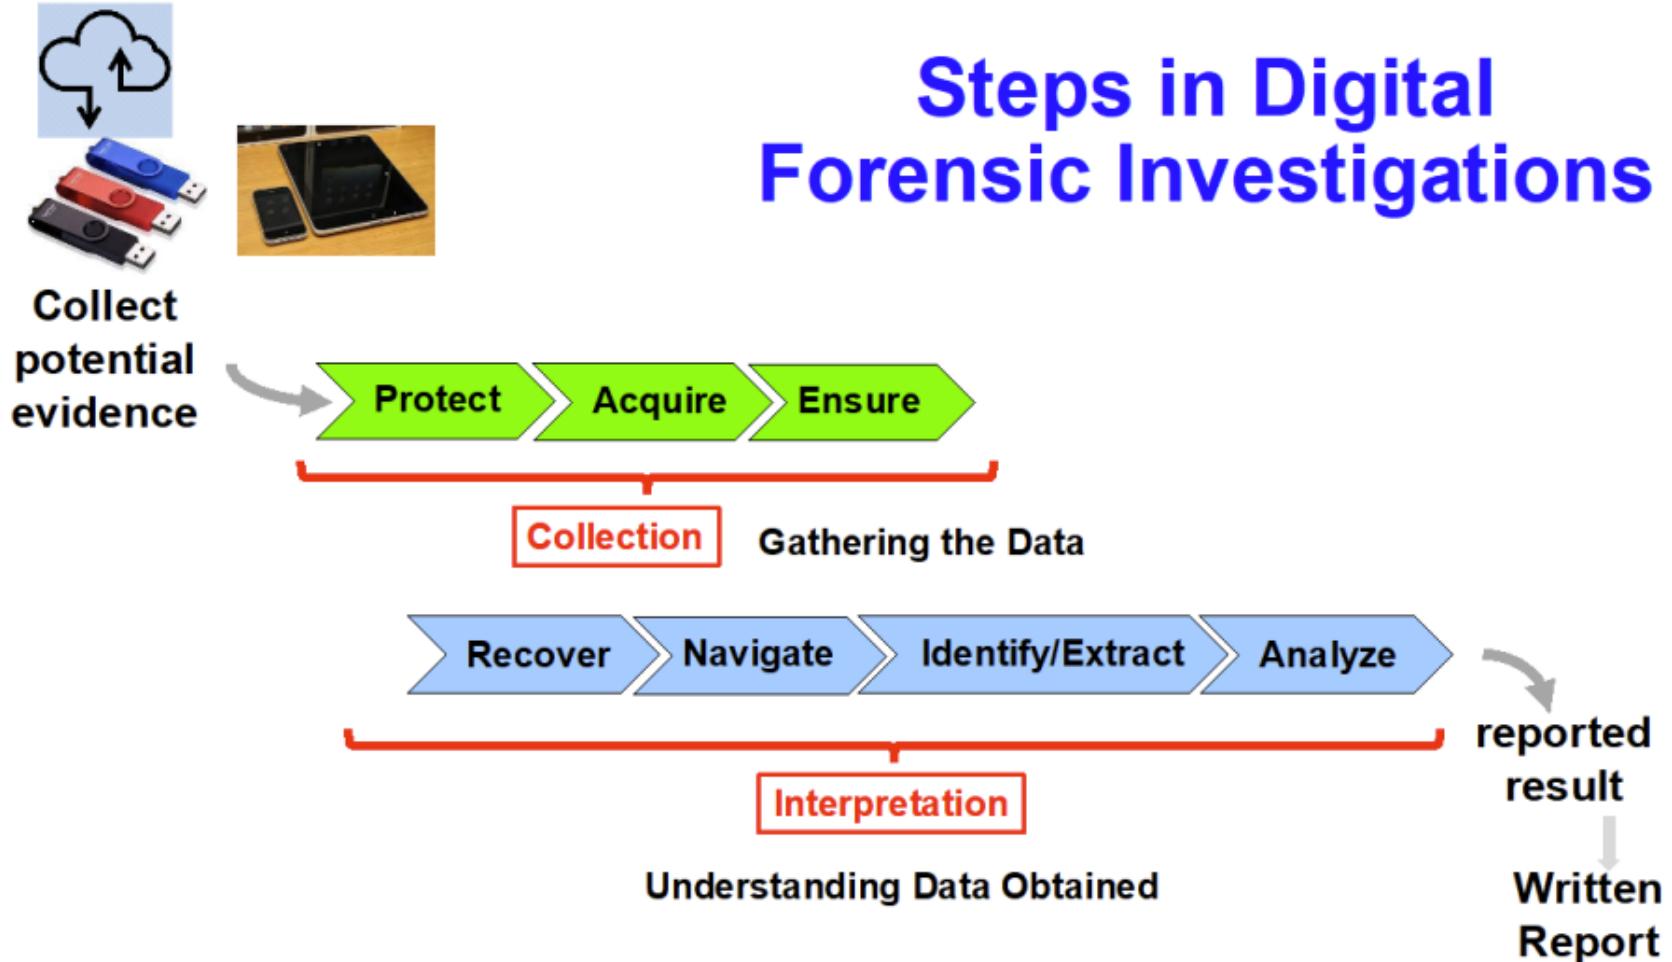

Abstract

This document is an assessment of the scientific foundations of digital forensics. We examined descriptions of digital investigation techniques from peer-reviewed sources, academic and classroom materials, technical guidance from professional organizations, and independently published sources. Digital investigation techniques are based on established computer science methods and when used appropriately are considered reliable. The process of evaluating, for example, the contents of a computer hard drive does not create information that was not there before the investigation started. However, because the field is rapidly changing there are limitations that practitioners and stakeholders need to be aware of: (1) as with any crime scene not all evidence may be discovered; (2) when recovering deleted files, the results may include extraneous material; (3) examiners need to understand that as software (operating systems and applications) are revised the meaning and significance of digital artifacts created by the software can change over time.

Steps in Digital Forensic Investigations

Steps in digital forensic investigations

- Collection
 - Protect original data from unintended modification
 - Acquire digital data
 - Ensure the integrity of acquired data
- Interpretation
 - Recover deleted data
 - Navigate and examine the acquired data
 - Identify and extract data artifacts
 - Analyze the artifacts

Ransomware Criminals Targeted in Ukrainian Police Raids
<https://www.youtube.com/watch?v=ANL1Kz3MuGk>

Evidence handling

- Evidence preservation
 - Identify affected activities when acquiring data on a running system
 - Determine whether to use a write blocker or loading tool into memory
- Evidence acquisition
 - Storage device, mobile device, embedded device, etc.
 - Remote and cloud acquisition
 - Data integrity verification
- Evidence documentation
 - Technical/Legal/Operational limitations
 - Chain of custody

Evidence preservation

Live vs post-mortem forensics

- To pull or not to pull the plug?
 - Attacker can change or destroy the evidence
 - Examiner's tools and acts may overwrite data or cause data loss
 - Can the system go back to normal operation after an unplanned switch off?
- Advantages and risks of live forensics
 - Can capture malware and encryption passwords from RAM
 - Can conduct live imaging of an encrypted drive, RAID, or non-supported file systems
 - The live system may be untrustworthy
 - Must run the forensic tool with Administrator privilege
 - Might affect the admissibility of digital evidence for cybercrime investigation

DFIR frameworks for cloud services

Cloud Incident Response Framework

Release Date: 05/04/2021

Working Group:

Cloud Incident Response

Preventive security controls cannot completely eliminate the possibility of critical data being compromised in a cyber attack. Therefore, organizations that utilize cloud services must ensure that they have a reliable cloud incident response strategy in place. Cloud incident response is simply the process used to manage cyber attacks in a cloud environment. There are several key aspects of a cloud incident response system that differentiate it from a non-cloud incident response system, notably in the areas of governance, shared responsibility, and visibility.

Who it's for:

- All cloud customers
- Cloud service providers who need a clear framework for sharing incident response practices with customers

This framework created by the Cloud Incident Response Working Group serves as a go-to guide for cloud customers to effectively prepare for and manage cloud incidents. It explains how to assess an organization's security requirements and then opt for the appropriate level of incident protection. Cloud customers will learn how to negotiate with cloud service providers, select security capabilities that are made-to-measure, and divide security responsibilities.

Key Takeaways:

- How to effectively manage cloud incidents through the entire lifecycle of a disruptive event, including:
 - Preparation
 - Detection and analysis
 - Containment, eradication, and recovery
 - Post-mortem
- How to coordinate and share information with stakeholders and other organizations

Digital Forensics and Incident Response (DFIR) Framework for Operational Technology (OT)

Published: June 22, 2022

Author(s)

Eran Salfati, Michael Pease

Abstract

This document provides a new Incident Handling framework dedicated to Operational Technology. This framework expands the traditional technical steps by giving an Incident Response procedure based on the event escalation and provides techniques for OT Digital Forensics. It includes an overview with general terms explanation and a list of unique properties of OT DFIR, the preparation that should be done to establish an OT Incident Response Team, and finally, the suggested OT Incident Handling framework in detail.

Digital forensics report

Executive Summary

เมื่อวันที่ [REDACTED] ทีม MFEC CSOC ได้รับการประสานเพื่อตรวจสอบเว็บไซต์ [REDACTED] เพื่อรับสืบเนื่องจากการโจมตี พร้อมเสนอแนวทางการป้องกันและแก้ไขมั่นคง

ผลการวิเคราะห์พบว่าเว็บไซต์ [REDACTED] ถูกโจมตีโดยใช้เครื่องมือ anonymousfox ซึ่ง เป็นเครื่องมือล้ำชั้นปีที่มีความสามารถในการโจมตีเว็บไซต์ที่ใช้งาน WordPress พร้อมทั้งสามารถยึดระบบบริหารจัดการเว็บไซต์ เช่น cPanel หรือ WebHost Manager นอกจากนี้ ยังพบข้อมูลผู้ใช้ที่ติดกล่าวถูกโจรกรรมที่สำคัญตั้งแต่ [REDACTED] หรือก่อนหน้านั้น รวมทั้งถูกฝัง backdoor เพื่อใช้เข้าถึงระบบในภายหลังให้เป็นจำนวนมาก

แนวทางการป้องกันและแก้ไขมั่นคง แนะนำให้เปลี่ยนรหัสผ่านทุกอย่างที่อาจถูกโจมตี ไม่ว่าจะเป็นรหัสผ่านของเว็บไซต์ บัญชีทางการเงิน หรือแอปพลิเคชันต่างๆ ควรติดตั้งซอฟต์แวร์ป้องกันไวรัสและอัปเดตอย่างต่อเนื่อง ไม่ควรเชื่อมต่อเครือข่ายที่ไม่ปลอดภัย และหากพบว่ามีการเข้าถึงไม่ชอบด้วยกฎหมาย ควรแจ้งความต่อเจ้าหน้าที่执法 ทันท่วงทัน

TYPES OF DIGITAL FORENSICS REPORTS

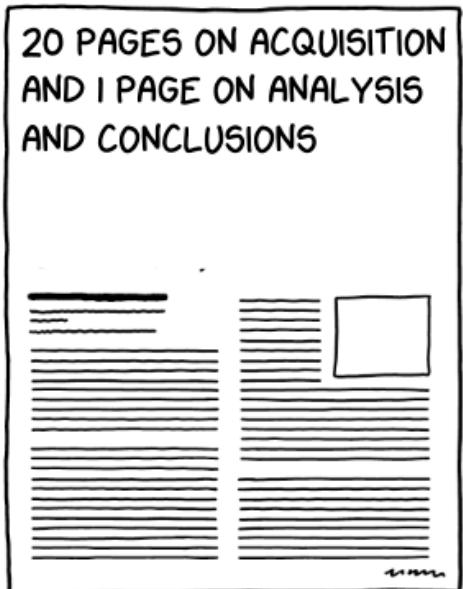

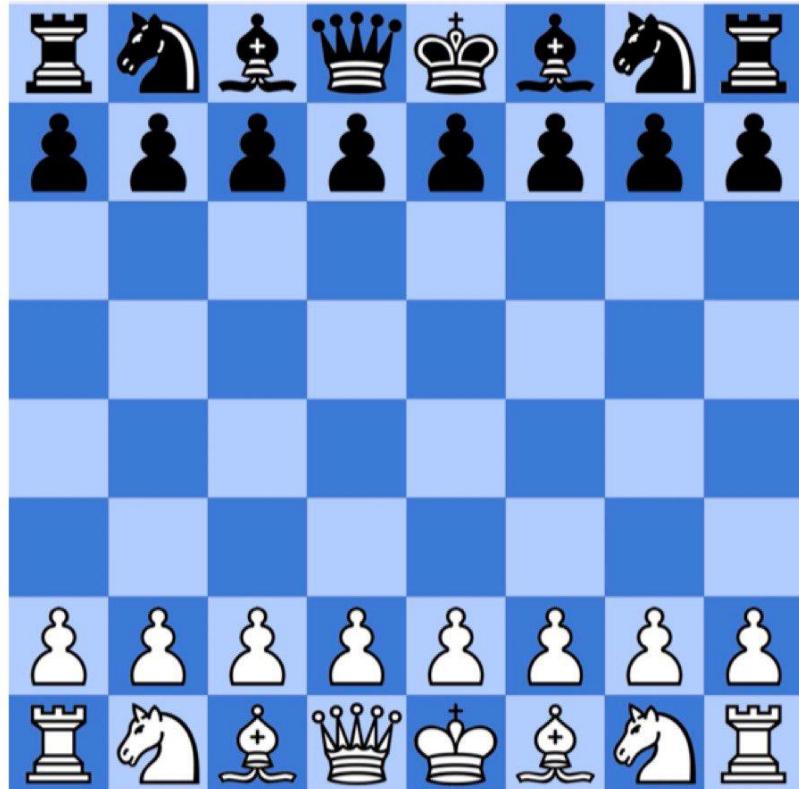

Photo: <https://twitter.com/AlexisBrignoni/status/1390539300748603392>

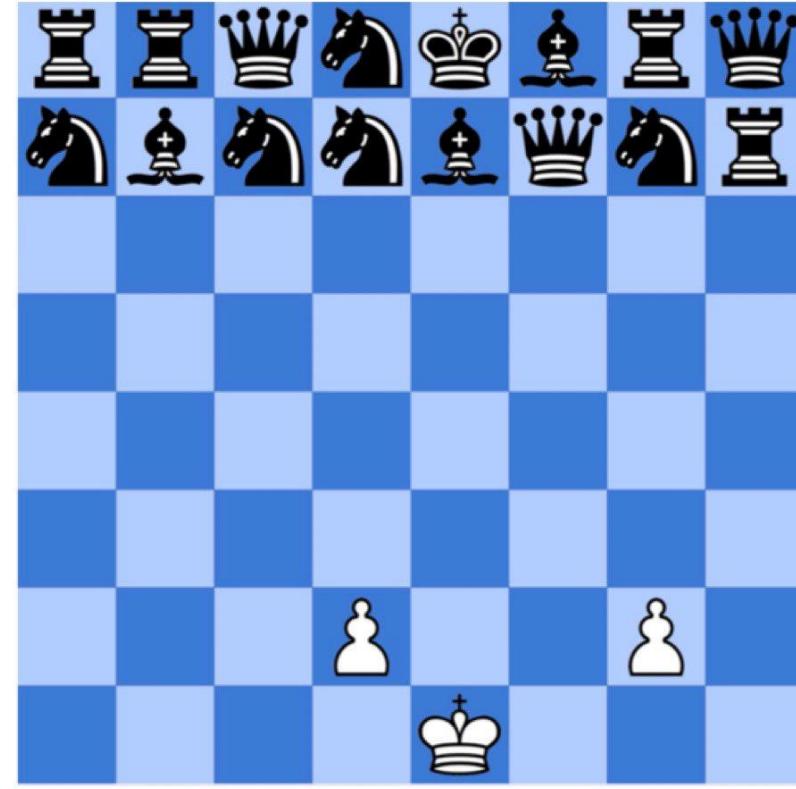

Limitations and concerns

- Dependent on an understanding of how the computer activities, tools, and techniques work
- Every digital forensic technique should undergo peer review, formal testing, or error rate analysis.
 - It is not feasible to test all combinations of tools, run time environments, and digital evidence sources.
- Standard operating procedure and legal
 - Will pieces of evidence and processes accept in the court?

Asymmetry between attackers and defenders

Theory

Real world

Computer Forensics Tool Testing Program (CFTT)

Welcome to the Computer Forensics Tool Testing (CFTT) Project Web Site.

There is a critical need in the law enforcement community to ensure the reliability of computer forensic tools. The goal of the Computer Forensic Tool Testing (CFTT) project at the National Institute of Standards and Technology (NIST) is to establish a methodology for testing computer forensic software tools by development of general tool specifications, test procedures, test criteria, test sets, and test hardware. The results provide the information necessary for toolmakers to improve tools, for users to make informed choices about acquiring and using computer forensics tools, and for interested parties to understand the tools capabilities. A capability is required to ensure that forensic software tools consistently produce accurate and objective test results. Our approach for testing computer forensic tools is based on well-recognized international methodologies for conformance testing and quality testing.

The Computer Forensics Tool Testing Program is a project in The [Software and Systems Division](#) supported by the [Special Programs Office](#) and the [Department of Homeland Security](#). Through the [Cyber Security Division Cyber Forensics](#) project, the Department of Homeland Security's Science and Technology partners with the NIST CFTT project to provide [forensic tool testing reports](#) to the public.

NEW: [Federated Testing](#) -- Guidance for common test methods & test report sharing via downloaded CD iso is available.

Computer Forensic Tool Testing (CFTT) Reports

S&T partners with the NIST Computer Forensic Tool Testing (CFTT) program to provide forensic tool testing reports to the public. The CFTT project has established a methodology for testing computer forensic software tools utilizing tool specifications, test procedures, test criteria, test sets, and test hardware. Report results encourage developers to update and improve tools and provide end users with information on tool capabilities necessary for use and acquisition.

Reports, organized by tool category, can be accessed and downloaded via the links below. Reports within each category are organized by publication date (newest to oldest).

Computer Forensic Reference Data Set (CFReDS)

Welcome to the new and improved Computer Forensic Reference Data Set Portal.

This portal is your gateway to documented digital forensic image datasets. These datasets can assist in a variety of tasks including tool testing, developing familiarity with tool behavior for given tasks, general practitioner training and other unforeseen uses that the user of the datasets can devise. Most datasets have a description of the type and locations of significant artifacts present in the dataset. There are descriptions and finding aides to help you locate datasets by the year produced, by author, or by attributes of the dataset.

All of the datasets produced by NIST to support the Computer Forensic Tool Testing and Federated Testing projects are included here as well as many other collections. See the  icon on the left sidebar for a list of the major collections.

PUBLICATIONS

NIST SP 800-86

Guide to Integrating Forensic Techniques into Incident Response

Date Published: August 2006

Author(s)

Karen Kent (NIST), Suzanne Chevalier (BAH), Tim Grance (NIST), Hung Dang (BAH)

Abstract

This publication is intended to help organizations in investigating computer security incidents and troubleshooting some information technology (IT) operational problems by providing practical guidance on performing computer and network forensics. The guide presents forensics from an IT view, not a law enforcement view. Specifically, the publication describes the processes for performing effective forensics activities and provides advice regarding different data sources, including files, operating systems (OS), network traffic, and applications. The publication is not to be used as an all-inclusive step-by-step guide for executing a digital forensic investigation or construed as legal advice. Its purpose is to inform readers of various technologies and potential ways of using them in performing incident response or troubleshooting activities. Readers are advised to apply the recommended practices only after consulting with management and legal counsel for compliance concerning laws and regulations (i.e., local, state, Federal, and international) that pertain to their situation.

Evidence examination & analysis

- Using data from data files
 - File system, MAC times, data integrity
- Using data from operating systems
 - Volatile/Non-volatile data
 - OS data
- Using data from network traffic
 - Identifying network data sources
 - collecting and examining network activities
- Using data from applications
 - Email, web, file sharing, security applications

Attack kill chain

Microsoft – Advanced Threat Analytics

<https://learn.microsoft.com/en-us/advanced-threat-analytics/ata-threats>

Adversary tactics, techniques, and data sources

Tactic	Common Techniques	Log and Event Sources	Indicators
<u>Initial Access</u>	Phishing [T1566], Drive-by Compromise [T1189], Exploit Public Facing Application [T1190], External Remote Services [T1133]	Email, web proxy, server application logs, IDS/IPS	Phishing, redirect, and payload servers (domains and IP addresses), delivery mechanisms (lures, macros, downloaders, droppers, etc.), compromised credentials, web shells
<u>Execution</u>	Command and Script Interpreters [T1059], Exploitation for Client Execution [T1203]	Host event logs, Windows event logs, Sysmon, anti-malware, EDR, PowerShell logs	Invocation of command or scripting interpreter, exploitation, API calls, tools, malware, payloads
<u>Persistence</u>	Account Manipulation [T1098], Scheduled Task/Job [T1053], Valid Accounts [T1078]	Host event logs, Authentication logs, Registry	Scheduled Tasks, registry keys, autoruns, etc.
<u>Lateral Movement</u>	Exploitation of Remote Services [T1210], Remote Session Hijacking [T1563], Software Deployment Tools [T1072]	Internal network logs, host event logs, Application Logs	Mismatch of users and applications/credentials, workstation to workstation communication, beaconing from hosts not intended to be internet accessible, etc.
<u>Credential Access</u>	Brute Force [T1110], Modify Authentication Process [T1556], Man-in-the-Middle [T1557]	Authentication Logs, Domain Controller Logs, network traffic monitoring	LSASS reads, command or scripting interpreters accessing LSASS, etc.
<u>C2</u>	Application Layer Protocol [T1071], Protocol Tunneling [T1572]	Firewall, Web Proxy, DNS, Network Traffic, Cloud activity logs, IDS/IPS	C2 domains, IP addresses
<u>Exfiltration</u>	Exfiltration Over C2 Channel [T1041], Exfiltration Over Alternative Protocol [T1048]	Firewall, Web Proxy, DNS, Network Traffic, Cloud activity logs, IDS/IPS	Domains, URLs, IP addresses, IDS/IPS signatures

APPENDIX A: DFL SKILLSET CHECKLIST

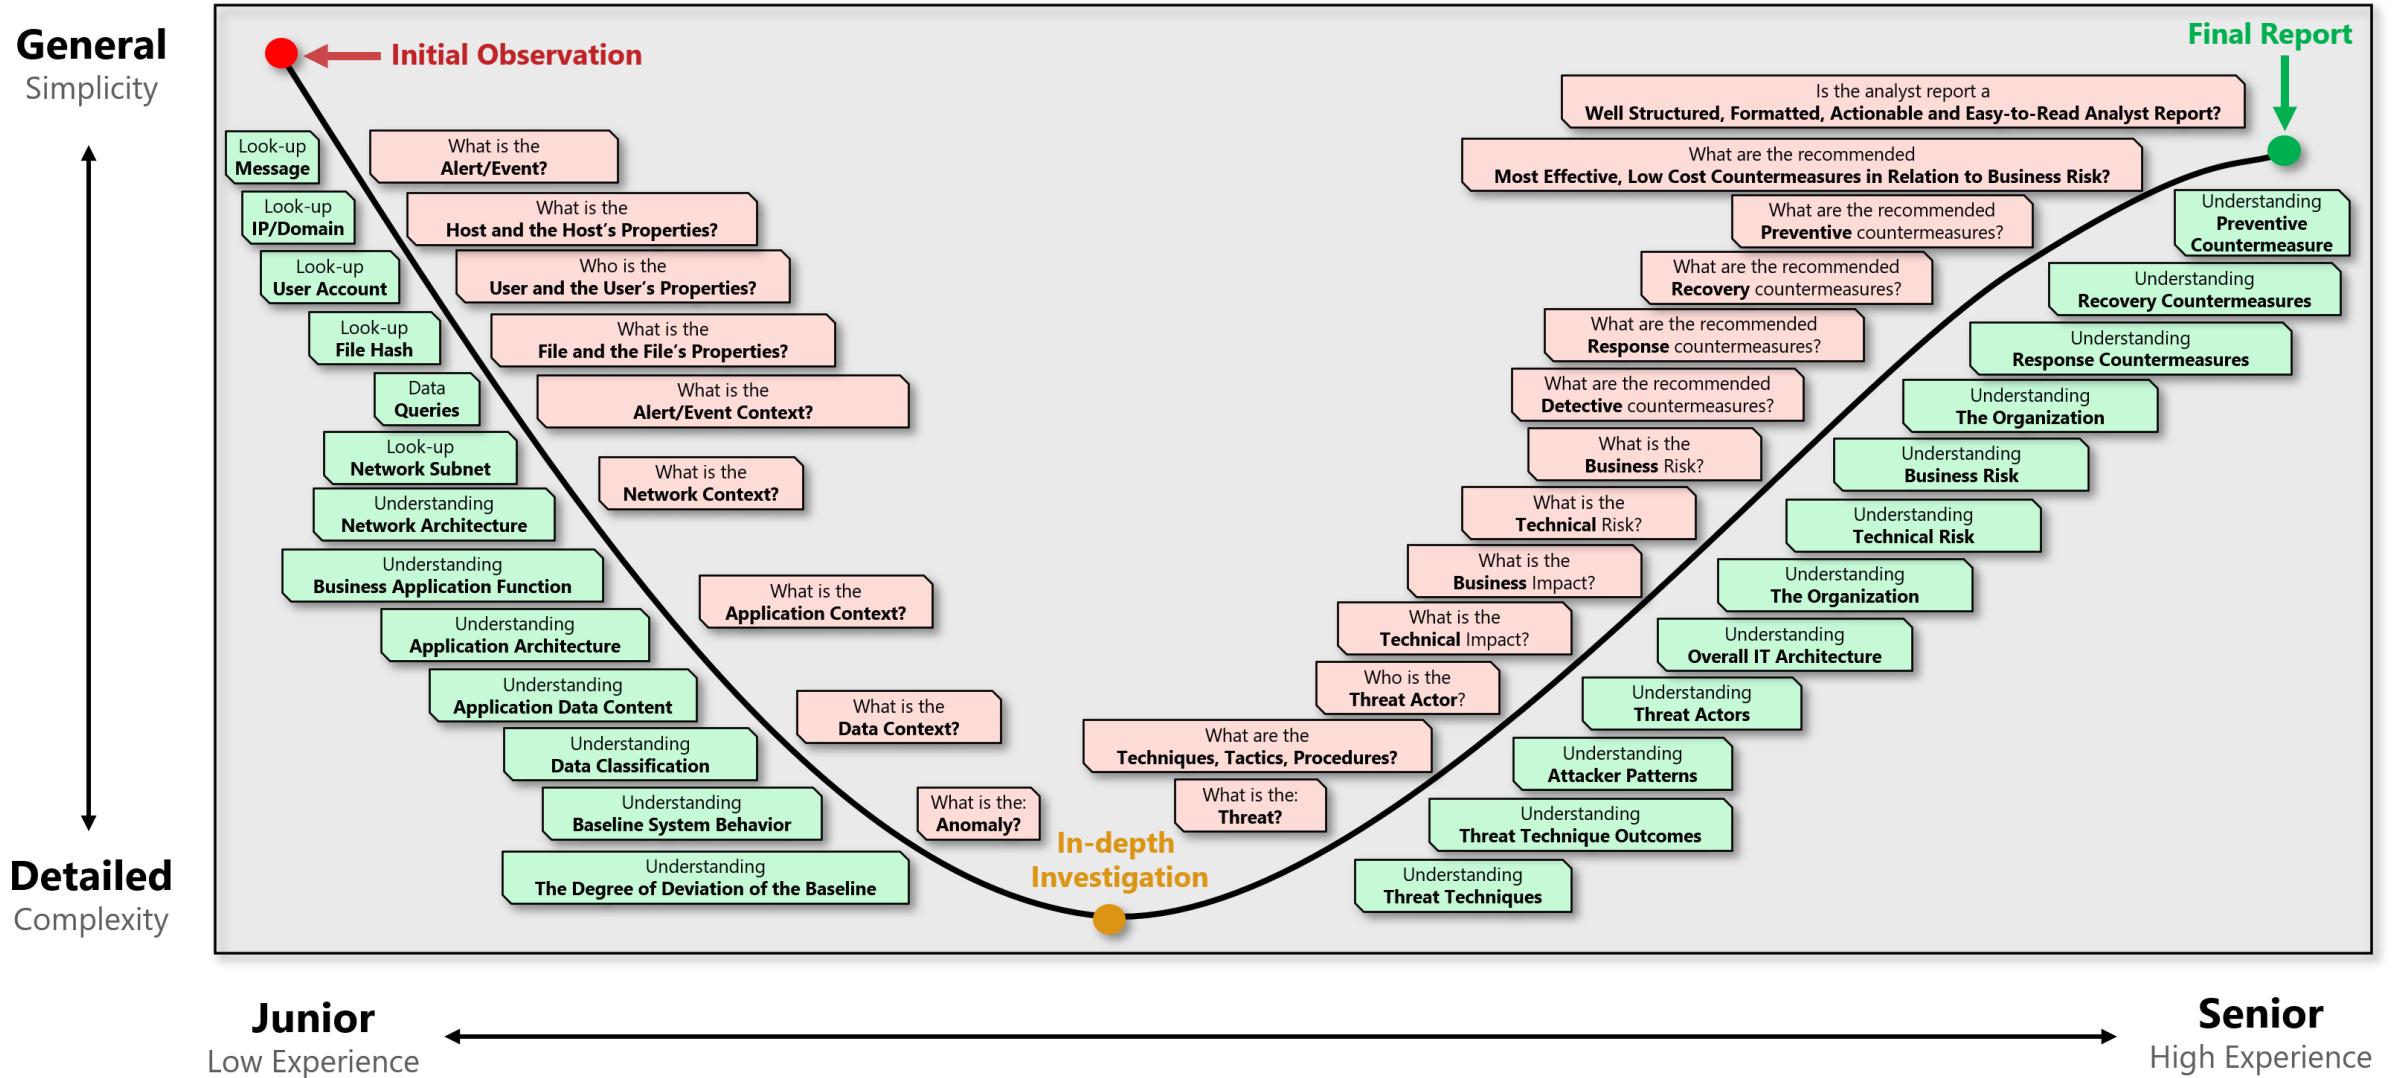

The following is a recommendation of skillsets for the DFL Examiner. The reader shall take note that the list is non-exhaustive and needs to be updated from time to time.

Category	Topic	Skillset	
Foundation	Computer Foundation	Organization of computer; How computer stores data; Bits & bytes; Evolution of digital media and storage system.	<input type="checkbox"/>
	File System	Decimal, hexadecimal, binary; Little endian, big endian; Sectors, cluster, slack space; Metadata, data, filename, FAT, NTFS, EXT, HFS.	<input type="checkbox"/>
	Introduction to Investigation and Digital Forensics	Law enforcement and regulators; Introduction to forensic science, electronic evidence and its nature; Categories of electronic evidence; Methodology; Forensics terminologies.	<input type="checkbox"/>
Identification	Information Gathering	Gather facts of the case online; Preserve the gathered facts.	<input type="checkbox"/>
Collection and Examination	Collection and Examination	First responder roles and SOP; Dead acquisition and live acquisition; Choosing the best data acquisition method; Triage method; Triage tool.	<input type="checkbox"/>
Analysis	Data Recovery	Storage technology; Damaged hard disk and flash drive symptoms; Logical and physical recovery; Data recovery tools; Recovery of data using tools.	<input type="checkbox"/>
	Computer Forensics	Operating systems technology; Metadata, registry, artefact; Data Extraction; Data analysis; Data hiding technique; Analytics for large sets of data; Memory Analysis.	<input type="checkbox"/>
	Mobile Phone Forensics	Mobile phone Technology and evolution, User, telecommunication provider technology, types of data, acquire and analysis tools, preservation of data.	<input type="checkbox"/>
	Network Forensics	Network Types; Internet history files and Cookies; User Credentials; Network forensic tools; Reading packets.	<input type="checkbox"/>
	Audio, Video and Image Forensics	Understanding the technology; Enhancement; File Authentication; Comparison.	<input type="checkbox"/>
	Emerging Technology:	Understanding the technology; Accessing data from the device; Data Extraction; Data	<input type="checkbox"/>

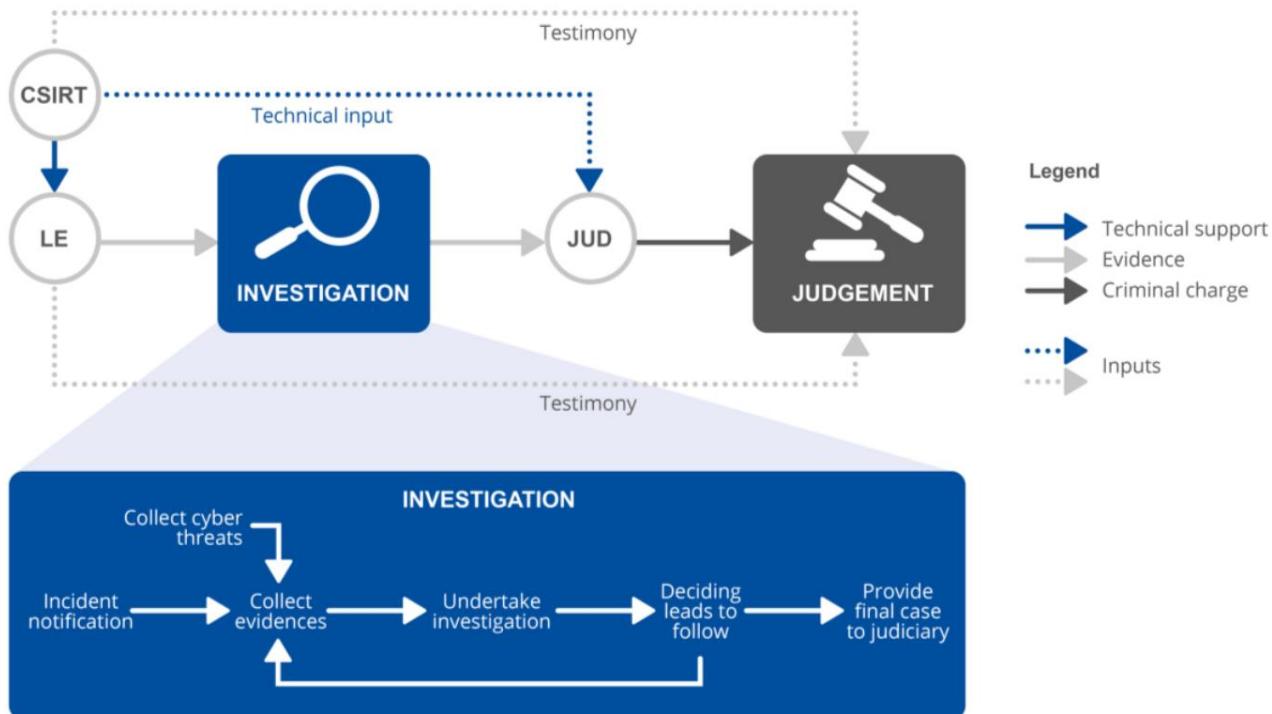

- Social Media Forensic - Database Forensic - Drone Forensic - Vehicle Forensic - Shipbourne forensic - Cryptocurrency Forensic - Biometric Forensic	analysis; Data interpretation; Reporting the findings.	<input type="checkbox"/>	
Presentation	Report Writing	The format of the report; Effective result presentation to stakeholders.	
	Law & Mock Court	Laws related to cases; International Law; International Collaboration; Presenting expert testimony in court; Introduction to Court structure; Submitting electronic evidence in court.	
Etiquette	Etiquette	Professional Code of ethics, ethical & non-ethical code of conduct.	<input type="checkbox"/>
Lab Management	Quality Management	Understanding standards; Conducting Audit; Quality Management System.	
	Health & Safety	Identify hazards; Health and Safety measures; Self-protection.	

Cyber Security Analyst Maturity Curve

"A senior cyber security analyst should be able to reach the **simplicity at the far side of complexity** and to be able to communicate the cyber security risks, threats and related countermeasures **simply, effectively and actionable.**"

Cooperation between CSIRT and LE

ENISA - Roadmap on the cooperation between CSIRT and LE

<https://www.enisa.europa.eu/publications/support-the-fight-against-cybercrime-roadmap-on-csirt-le-cooperation>

CSIRT and LE: Cooperation problems

Not all cyber incidents are cybercrimes (so LE do not need to be informed) and not all cybercrimes are considered cyber incidents (so CSIRTs do not need to be informed). This means that LE and CSIRTs do not always have the same interest in incidents or investigations, which also affects the way they further handle each case. Since cybercrime crosses borders, cooperation among countries is often crucial in the fight against it. In this regard, at least three difficulties are identified:

3. **Difficulties related to different mindset approaches.** CSIRT, LE and the judiciary have different approaches or mindsets, which also derives from the different educational and scientific backgrounds. In particular, CSIRTs have a ‘technical mentality’ while the judiciary has a ‘legal mentality’. The LE have partly a ‘legal mentality’ and partly a ‘technical mentality’ that is entrenched in how society operates in the area of crime. The different mentalities make communication among these three entities not always easy. This can also lead to limitations of cooperation or at least a slowdown in cooperation.

Traditional vs Enterprise forensics

Traditional forensics	Enterprise forensics
Scope <ul style="list-style-type: none">• Small amount of machines/devices	Scope <ul style="list-style-type: none">• Large scale DFIR• Varies environment (remote, cloud, VM, etc.)
Process <ul style="list-style-type: none">• Memory acquisition• Storage/Disk acquisition• Network artifacts collection	Process <ul style="list-style-type: none">• Isolation, snapshot, triage, etc.• Remote/live forensics
Concerns <ul style="list-style-type: none">• Business continuity• Time consumption	Concerns <ul style="list-style-type: none">• Evidence preservation• Legal and court testimony

Anti-forensics

Purposes

- Making investigation more complicated and time-consuming
- Making evidences difficult or impossible to obtain

Methods

- Artifact wiping
- Data hiding
- Trail obfuscation
- Encryption
- Steganography
- Attack against forensic tool and methods
- Self-destruction/kill-switch

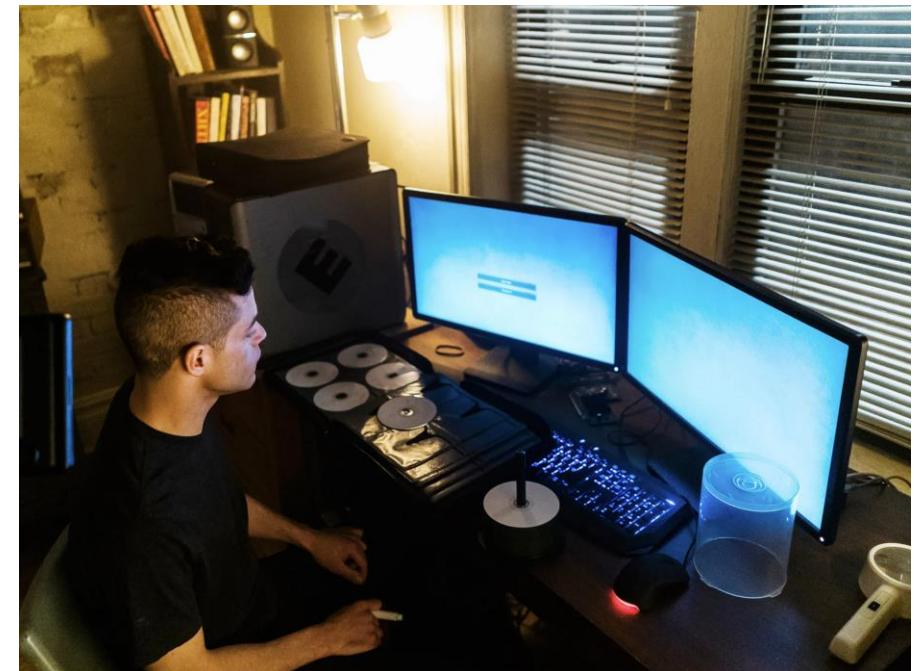

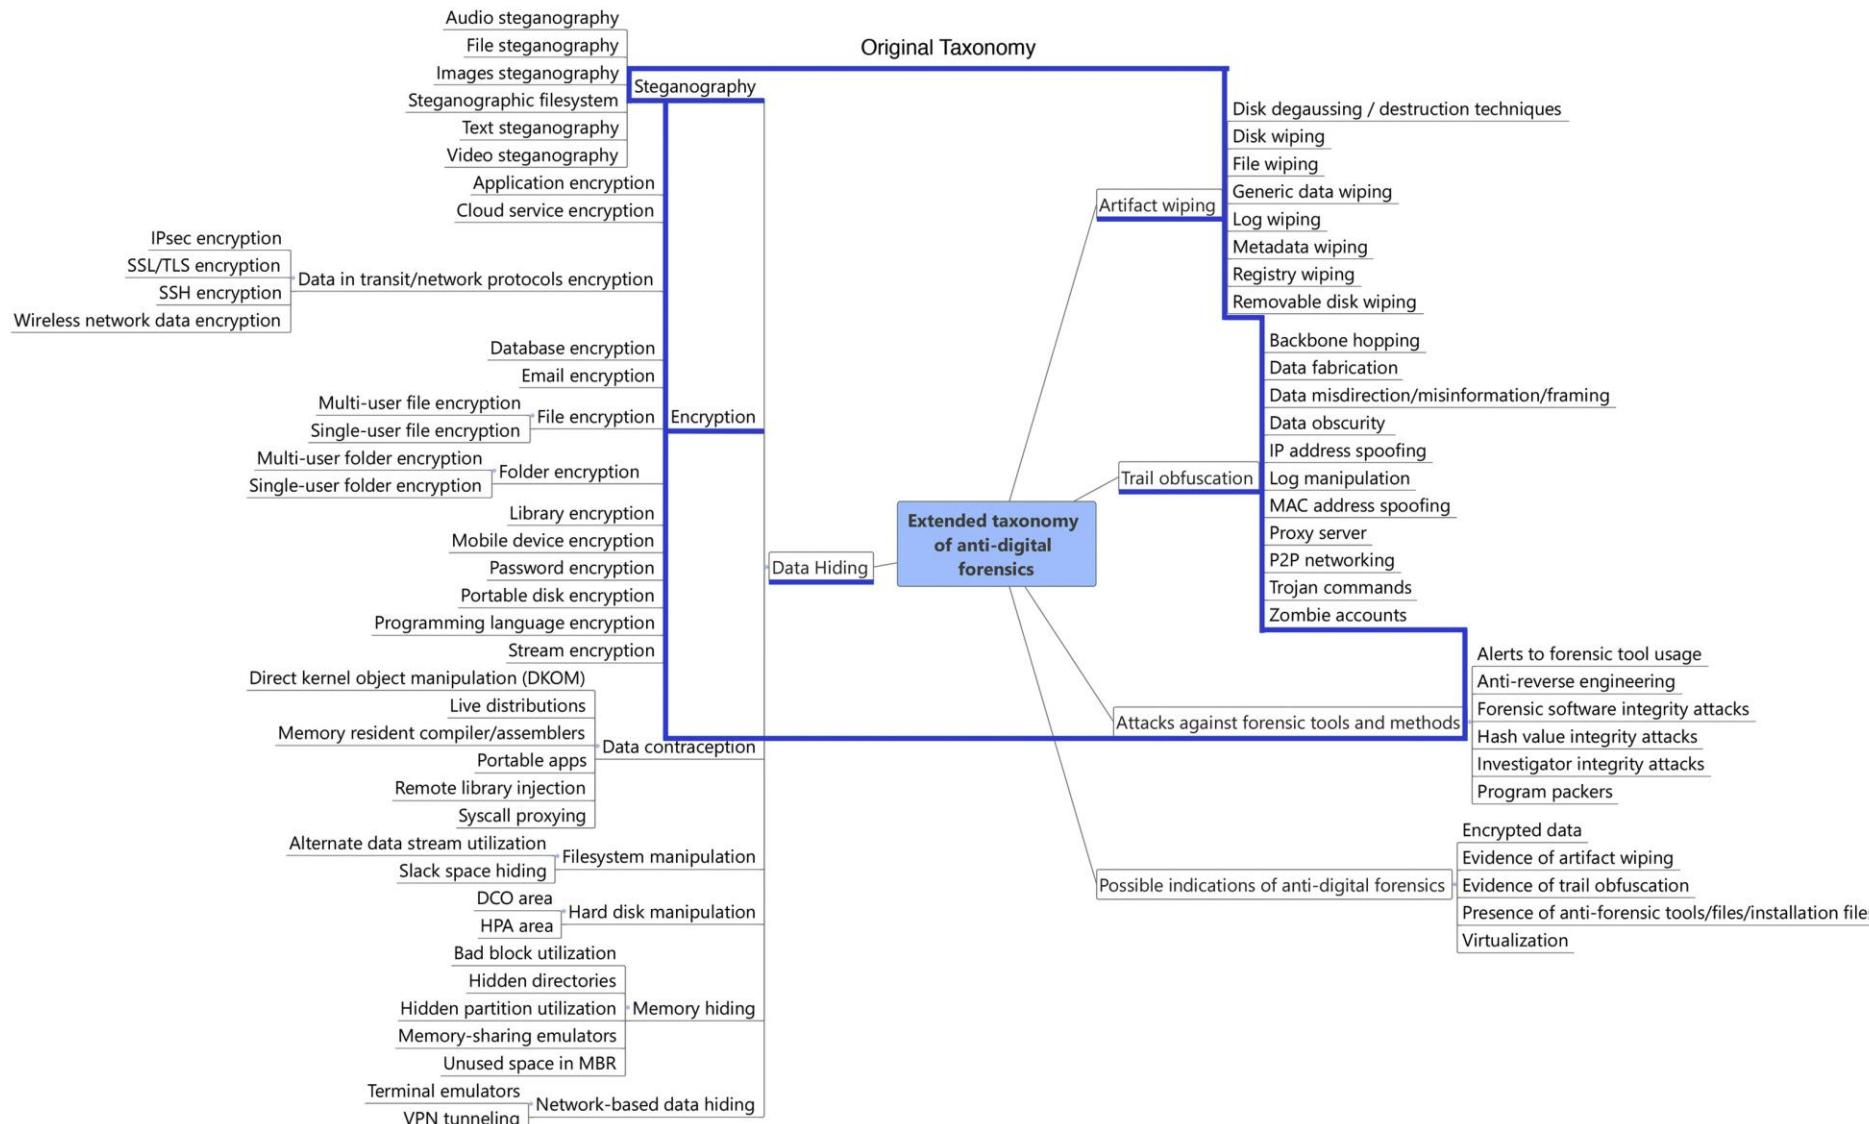

Photo: <https://www.wired.com/2016/07/mr-robot-hack-check-s2e2/>

Awesome anti-forensics

<https://github.com/shadawck/awesome-anti-forensic>

* Items underlined and inside the blue frame were categories previously identified in the original anti-forensics taxonomy proposed by Rogers (2006). Our taxonomy is an extended, more granular version of the old one.

Extended taxonomy of anti-digital forensics

- Artifact wiping**
 - Disk degaussing / destruction techniques
 - Disk wiping
 - File wiping
 - Generic data wiping
 - Log wiping
 - Metadata wiping
 - Registry wiping
 - Removable disk wiping
- Trail obfuscation**
 - Backbone hopping
 - Data fabrication
 - Data redirection/misinformation/framing
 - Data obscurity
 - IP address spoofing
 - Log manipulation
 - MAC address spoofing
 - Proxy server
 - P2P networking
 - Trojan commands
 - Zombie accounts
- Attacks against forensic tools and methods**
 - Alerts to forensic tool usage
 - Anti-reverse engineering
 - Forensic software integrity attacks
 - Hash value integrity attacks
 - Investigator integrity attacks
 - Program packers
- Possible indications of anti-digital forensics**
 - Encrypted data
 - Evidence of artifact wiping
 - Evidence of trail obfuscation
 - Presence of anti-forensic tools/files/installation files
 - Virtualization

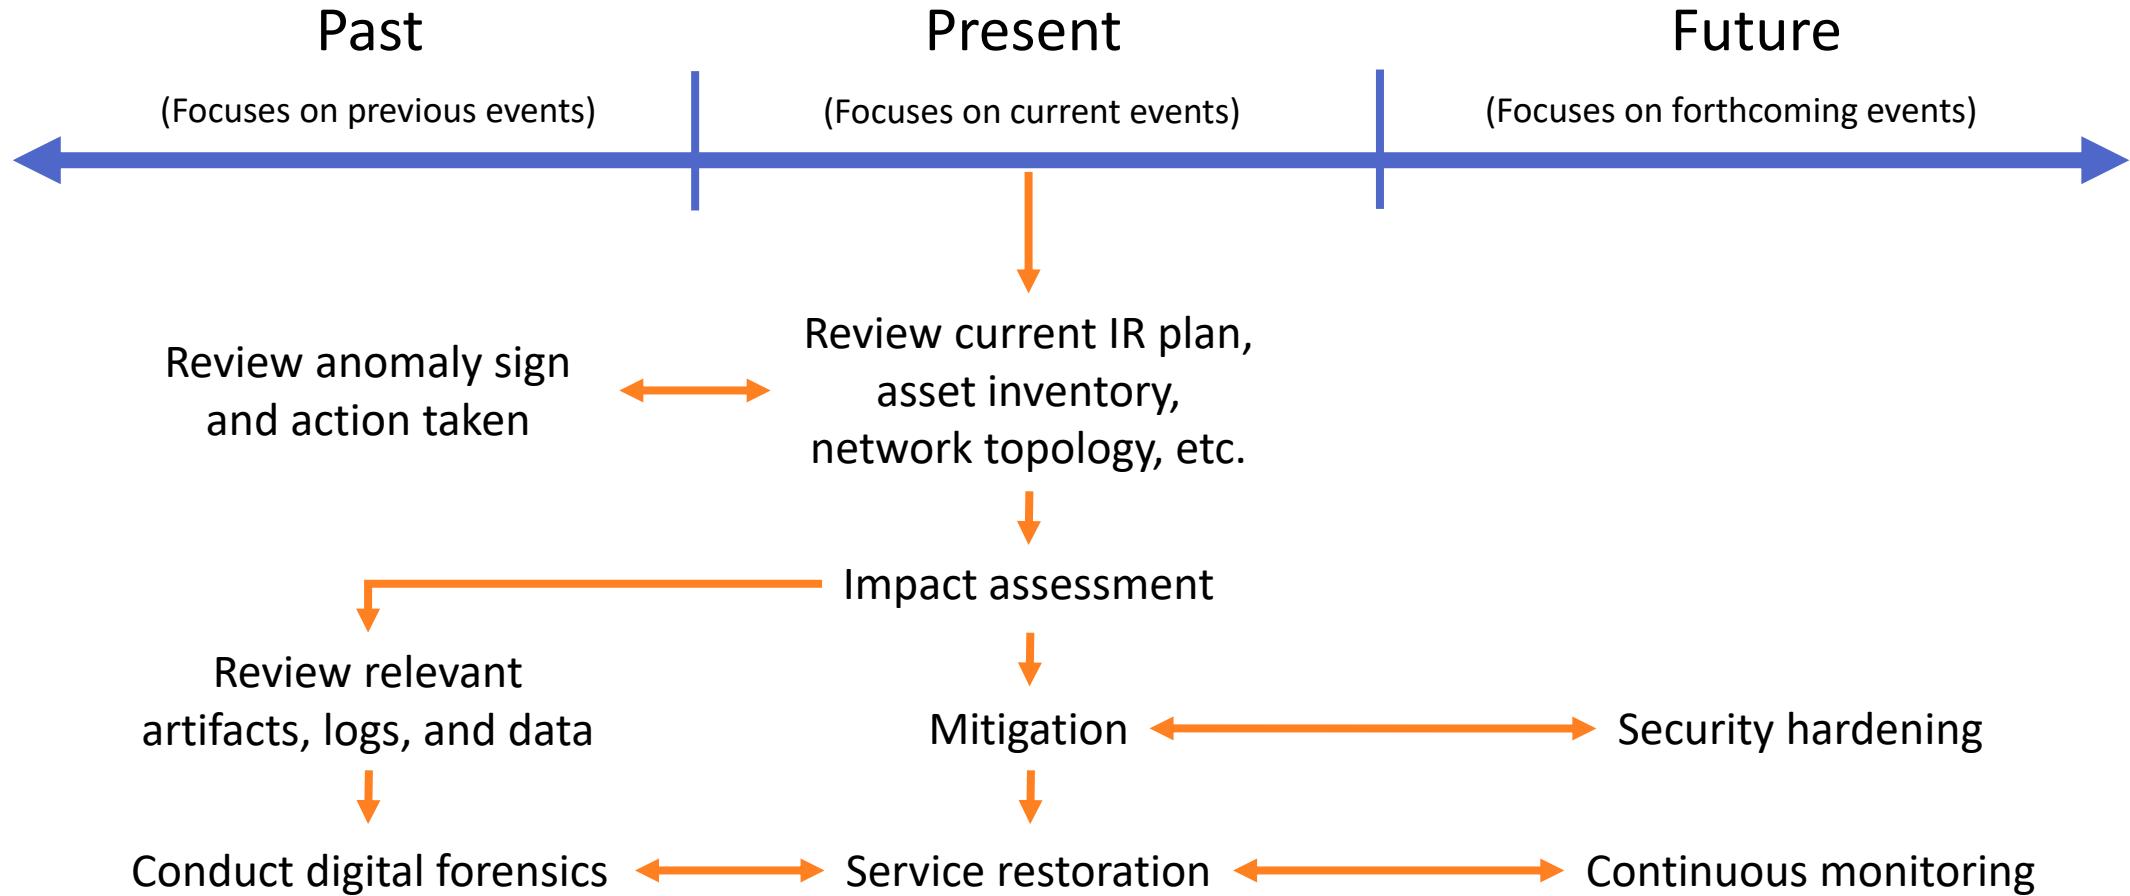

Case Studies

Case #1: Live incident response

Scenarios

- A large organization has been informed by a security researcher that their email server have been compromised
- Admin reviewed network log and found suspicious activities that indicate backdoor and data exfiltration
- The organization will conduct the most important event in the next few days

(Simplified) DFIR activities

Artifact and information collection – host

Host-Based Artifacts

- Running Processes
- Running Services
- Parent-Child Process Trees
- Integrity Hash of Background Executables
- Installed Applications
- Local and Domain Users
- Unusual Authentications
- Non-Standard Formatted Usernames
- Listening Ports and Associated Services
- Domain Name System (DNS) Resolution Settings and Static Routes
- Established and Recent Network Connections
- Run Key and other AutoRun Persistence
- Scheduled Tasks
- Artifacts of Execution (Prefetch and Shimcache)
- Event logs
- Anti-virus detections

Information to Review for Host Analysis

- Identify any process that is not signed and is connecting to the internet looking for beaconing or significant data transfers.
- Collect all PowerShell command line requests looking for Base64-encoded commands to help identify malicious fileless attacks.
- Look for excessive .RAR, 7zip, or WinZip processes, especially with suspicious file names, to help discover exfiltration staging (suspicious file names include naming conventions such as, 1.zip, 2.zip, etc.).
- Collect all user logins and look for outlier behavior, such as a time of login that is out of the ordinary for the user or a login from an Internet Protocol (IP) address not normally used by the user.
- On Linux/Unix operating systems (OSs) and services, collect all cron and systemctl /etc/passwd files looking for unusual accounts and log files, such as accounts that appear to be system / proc users but have an interactive shell such as /bin/bash rather than /bin/false/nologin
- On Microsoft OSs, collect Scheduled Tasks, Group Policy Objects (GPO), and Windows Management Instrumentation (WMI) database storage on hosts of interest looking for malicious persistence.
- Use the Microsoft Windows Sysinternals Autoruns tool, which allows IT security practitioners to view—and, if needed, easily disable—most programs that automatically load onto the system.
- Check the Windows registry and Volume Shadow Copy Service for evidence of intrusion.
- Consider blocking script files like .js, .vbs, .zip, .7z, .sfx and even Microsoft Office documents or PDFs.
- Collect any scripts or binary ELF files from /dev/shm/tmp and /var/tmp.
- Kernel modules listed (lsmod) for signs of a rootkit; dmesg command output can show signs of rootkit loading and device attachment amongst other things.
- Archive contents of /var/log for all hosts.
- Archive output from journald. These logs are pretty much the same as /var/log; however, they provide some integrity checking and are not as easy to modify. This will eventually replace the /var/log contents for some aspects of the system. Check for additional Secure Shell (SSH) keys added to user's authorized_keys.

Artifact and information collection – network

Network-Based Artifacts

- Anomalous DNS traffic and activity, unexpected DNS resolution servers, unauthorized DNS zone transfers, data exfiltration through DNS, and changes to host files
- Remote Desktop Protocol (RDP), virtual private network (VPN) sessions, SSH terminal connections, and other remote abilities to evaluate for inbound connections, unapproved third-party tools, cleartext information, and unauthorized lateral movement
- Uniform Resource Identifier (URI) strings, user agent strings, and proxy enforcement actions for abusive, suspicious, or malicious website access
- Hypertext Transfer Protocol Secure/Secure Sockets Layer (HTTPS/SSL)
- Unauthorized connections to known threat indicators
- Telnet
- Internet Relay Chat (IRC)
- File Transfer Protocol (FTP)

Information to Review for Network Analysis

- Look for new connections on previously unused ports.
- Look for traffic patterns related to time, frequency, and byte count of the connections.
- Preserve proxy logs. Add in the URI parameters to the event log if possible.
- Disable LLMNR on the corporate network; if unable to disable, collect LLMNR (UDP port 5355) and NetBIOS-NS (UDP port 137).
- Review changes to routing tables, such as weighting, static entries, gateways, and peer relationships.

Common mistakes in incident handling

- **Mitigating the affected systems before responders can protect and recover data**
 - This can cause the loss of volatile data such as memory and other host-based artifacts.
 - The adversary may notice and change their tactics, techniques, and procedures.
- **Touching adversary infrastructure (Pinging, NSlookup, Browsing, etc.)**
 - These actions can tip off the adversary that they have been detected.
- **Preemptively blocking adversary infrastructure**
 - Network infrastructure is fairly inexpensive. An adversary can easily change to new command and control infrastructure, and you will lose visibility of their activity.
- **Preemptive credential resets**
 - Adversary likely has multiple credentials, or worse, has access to your entire Active Directory.
 - Adversary will use other credentials, create new credentials, or forge tickets.
- **Failure to preserve or collect log data that could be critical to identifying access to the compromised systems**
 - If critical log types are not collected, or are not retained for a sufficient length of time, key information about the incident may not be determinable. Retain log data for at least one year.
- **Communicating over the same network as the incident response is being conducted (ensure all communications are held out-of-band)**
- **Only fixing the symptoms, not the root cause**
 - Playing “whack-a-mole” by blocking an IP address—without taking steps to determine what the binary is and how it got there—leaves the adversary an opportunity to change tactics and retain access to the network.

COMMON MISSTEPS

Common missteps an organization can make when first responding

Limitations and concerns

[REDACTED]

Virtual machine data acquisition

Data Collection

Suspend the Virtual Machine before taking memory images.

Virtual Box

Memory

- Identify the VM's UUID:
vboxmanage list vms
- Create a snapshot of the VM's memory:
vboxmanage debugvm <VM_UUID> dumpvpm-core --filename win10-mem.raw

Disk

- Identify the VM's UUID:
vboxmanage list vms
- Identify the VM's disk UUID:
vboxmanage showvminfo <VM_UUID>
Note the UUID of the disk in row IDE Controller
- Export the disk using the disk UUID:
vboxmanage clonemedium disk <disk_UUID>

VMWare

Memory

- Collect the .vmem and associated .vmss and .vmsn files if available

Disk

- Collect all .vmdk files associated with the current snapshot ID
- Alternatively, create a single VMDK from split files:
C:\Program Files (x86)\VMware\VMware Player\vmware-vdiskmanager.exe -r «d:\VMLinux\vmdiskname.vmdk» -t 0 MyNewImage.vmdk

Memory acquisition – planning

Fast artifact collection

- Prepare a batch script to acquire server information, process, network, and user activities

Full memory acquisition

- Require inserting and mounting USB storage to a physical server
- Require remote upload and execute forensic tool on the server
- Disable the energy-saving feature on the workstation

Memory acquisition – on-site problems

Active Directory hardening and recovery

The screenshot shows the Microsoft Learn website for Windows Server. The top navigation bar includes links for Microsoft Learn, Documentation, Training, Certifications, Q&A, Code Samples, Assessments, Shows, and Events. Below this, a secondary navigation bar for Windows Server includes links for Get started, Failover clustering, Management, Identity and access, Networking, Troubleshooting, and Related products. A search bar labeled 'Filter by title' is present. The main content area shows the 'Best Practices for Securing Active Directory' article under the 'Windows Server' category. The article title is 'Best Practices for Securing Active Directory'. It was published on 07/29/2021 by 9 contributors. The article applies to Windows Server 2022, 2019, 2016, 2012 R2, and 2012. The content discusses practical techniques for protecting an enterprise Active Directory environment, based on Microsoft's ISRM organization's experience. Key sections include Executive Summary, Introduction, and Avenues to compromise. The sidebar on the left lists other articles under 'Best Practices for Securing Active Directory', such as Executive Summary, Introduction, Avenues to compromise, Attractive Accounts for Credential Theft, Reducing the Active Directory attack Surface, Implementing Least-Privilege, Administrative models, Implementing Secure Administrative Hosts, Securing Domain Controllers Against attack, Monitoring Active Directory for Signs of compromise, Audit Policy Recommendations, Planning for compromise, and Maintaining a more Secure Environment.

Best Practices for Securing Active Directory
<https://learn.microsoft.com/en-us/windows-server/identity/ad-ds/plan/security-best-practices/best-practices-for-securin>

The screenshot shows a blog post titled 'Practical Compromise Recovery Guidance For Active Directory' on the Microsoft 365 Security website. The header features the Microsoft 365 Security logo and the tagline 'Everything about Microsoft Security'. The navigation bar includes links for M365 Advanced Hunting, Azure Sentinel, Azure Active Directory, KQL, Microsoft Identity, Windows OS, Jupyter Notebooks, and About. The main content area displays the blog post's title and a red banner indicating it was posted on April 27, 2021, by m365guy with one comment. The post discusses the lack of comprehensive guidance for recovering from an Active Directory compromise and aims to fill that gap. It highlights the goal of minimizing disruption while ensuring Tier-0 resources are protected. The sidebar on the right lists other navigation links.

Practical Compromise Recovery Guidance For Active Directory
<https://m365internals.com/2021/04/27/practical-compromis>

Case #1: Lessons learned

- Evaluate the need for full memory acquisition
 - Explain when and why it is required or not required
- Ensure a safe and clean working environment
 - Scope of the compromise might not be limited to the server zone
- Consider alternative methods
 - Snapshot, duplicate, and conduct live analysis
- Prepare for the worst-case scenario

Case #2: Investigating banking trojan

Scenarios

- A bank's customer chatted with an attacker and has been tricked to install malware on their computer, amount of money has been transferred to an attacker's account
- The victim ran multiple antimalware tools on their machine, some artifacts have been deleted
- An infected machine has been shut down before the forensics team arrived at the scene

Remaining artifacts and limitations

Artifacts and supporting information

- Windows event log
- Web browser history
- Antimalware log
 - All quarantined files were encrypted
- Chat history log
 - All chats were encrypted
- Online banking activity log
 - Provided by the victim's bank

Findings

[REDACTED]

Decrypting the encrypted files

Where is the key?

- Quarantined malware files -> Unlock via Windows account password
- Chat history log -> Unlock via viewing with the chat app

Booting up the machine

- Restore the disk image to another hard drive and then boot it from an original machine
- Convert a raw disk image to a VM disk and then start the VM

Converting a raw image to a VM disk

Converting between image formats

| « | » | ↻ | ⚡

Converting images from one format to another is generally straightforward.

`qemu-img convert`: raw, qcow2, qed, vdi, vmdk, vhd

The `qemu-img convert` command can do conversion between multiple formats, including `qcow2`, `qed`, `raw`, `vdi`, `vhd`, and `vmdk`.

`qemu-img` format strings

Image format	Argument to <code>qemu-img</code>
QCOW2 (KVM, Xen)	<code>qcow2</code>
QED (KVM)	<code>qed</code>
raw	<code>raw</code>
VDI (VirtualBox)	<code>vdi</code>
VHD (Hyper-V)	<code>vpc</code>
VMDK (VMware)	<code>vmdk</code>

This example will convert a raw image file named `image.img` to a qcow2 image file.

```
$ qemu-img convert -f raw -O qcow2 image.img image.qcow2
```

Run the following command to convert a vmdk image file to a raw image file.

```
$ qemu-img convert -f vmdk -O raw image.vmdk image.img
```

Run the following command to convert a vmdk image file to a qcow2 image file.

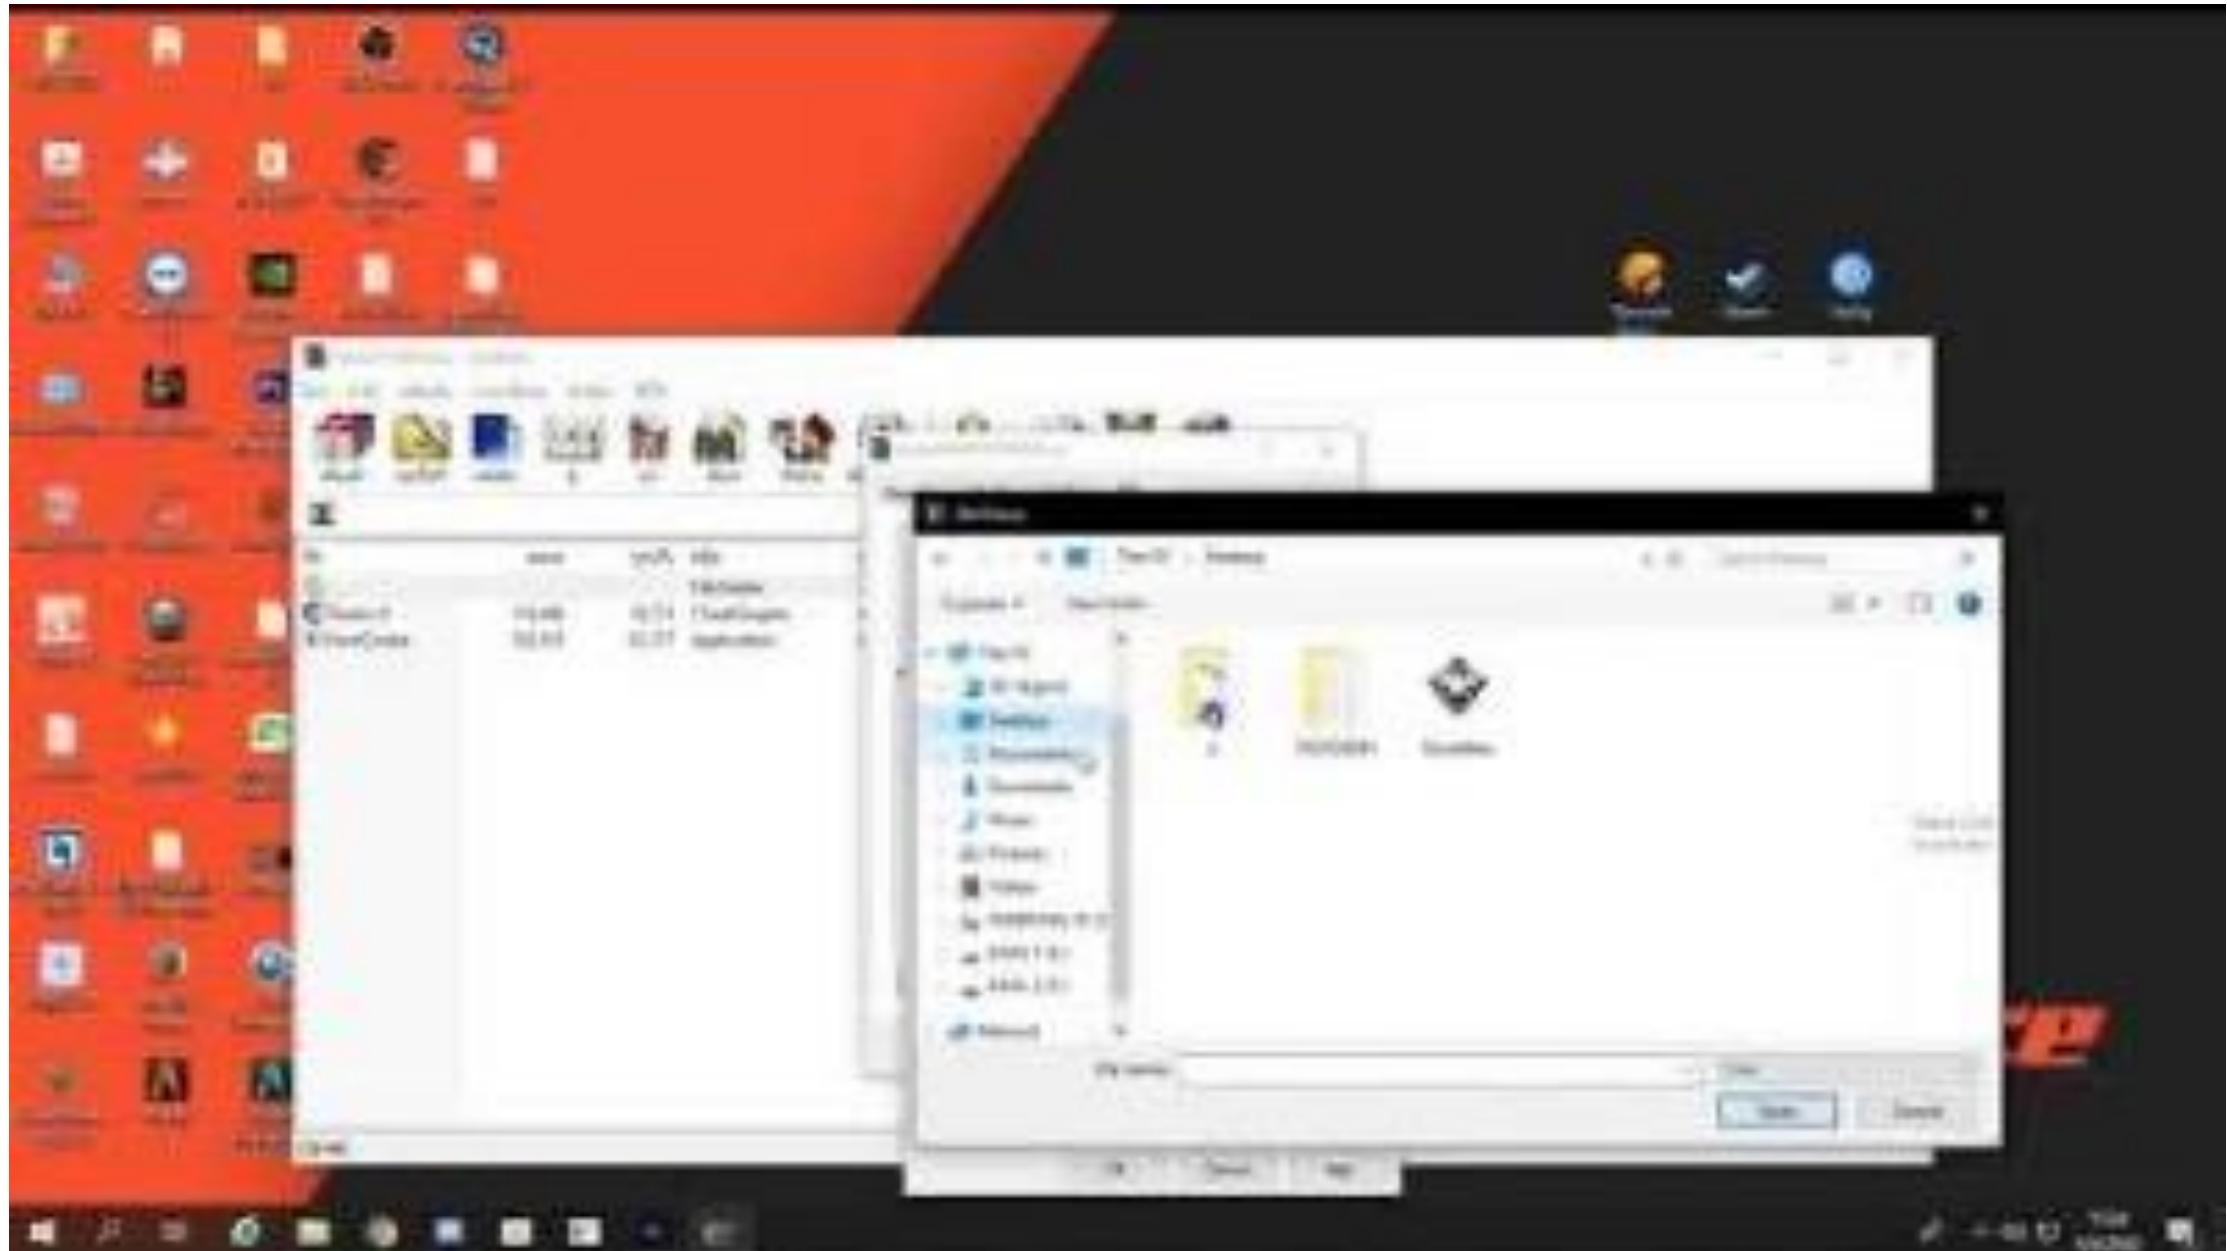

```
$ qemu-img convert -f vmdk -O qcow2 image.vmdk image.qcow2
```

Sample victim's data in the suspected machine

[REDACTED]

Case #2: Lessons learned

- Remediation actions might affect forensic capabilities
 - Important data could be lost
- Learn more about the limitations of anti-forensic tools
 - Some privacy cleaner tools can be used to wipe attacker's traces
 - Look for the places that might contain data in RAM
